

Q-List two advantages and two disadvantages of using RADIUS for network authentication in a public hotspot (like those found in malls or airports).

Advantages	Disadvantages
1. Centralized authentication – A single RADIUS server can authenticate many users and access points, making user management easier.	1. Server dependency – If the RADIUS server becomes unavailable, new users may not be able to authenticate and access the Wi-Fi.
2. Better access control – RADIUS can authenticate users and provide policies such as session limits, VLAN assignment, or other network-access parameters.	2. Configuration complexity – Setting up RADIUS, certificates/802.1X, access points, and user databases can be more complicated than using a simple Wi-Fi password.
