

Q-List 3 real-world use cases where TACACS+ is preferred over RADIUS, and briefly explain why TACACS+ is better suited for each scenario.

Real-world use case	Why TACACS+ is preferred over RADIUS
1. Cisco Router/Switch Administration	TACACS+ is designed for network device administration and provides separate authentication, authorization, and accounting (AAA) .
2. Controlling Individual CLI Commands	TACACS+ can authorize users command-by-command , allowing an administrator to permit some commands while denying others. RADIUS generally does not provide this same level of device-command control.
3. Large Enterprise Network Management	Network administrators can use TACACS+ to centrally control who can log in to routers, switches, and firewalls and what they are allowed to do . Its separation of AAA makes detailed administrative policies easier to implement.
