

# **Storage Connection Fault Simulation Report**

## **Test Procedure and Observations**

### **1. Initial System Check (Drive Connected)**

#### **Action:**

- Powered on the test system with the storage drive properly connected.

#### **Observed Results:**

- System completed POST (Power-On Self-Test).
- BIOS/UEFI detected the storage device.
- Boot drive appeared in the boot priority list.
- Operating system loaded normally.

#### **Example BIOS Indicator:**

- Storage device listed under SATA/NVMe information:
    - Example: "SATA SSD: Detected"
    - Example: "NVMe Drive: Present"
- 

### **2. Simulated Drive Disconnection**

#### **Action:**

- Powered off the system.
- Disconnected the SATA data cable/power cable or removed the NVMe drive from its slot (simulation).

#### **Observed Results:**

- System could no longer locate the operating system drive.

#### **Possible Error Messages:**

- "No boot device found"
- "Boot device not detected"
- "Insert proper boot device and press any key"
- "Operating system not found"

#### **BIOS Indicators:**

- Storage drive missing from the SATA/NVMe device list.
  - Boot option for the drive no longer available.
- 

### **3. Drive Reconnection**

#### **Action:**

- Powered off the system again.
- Reconnected the SATA cable/power connector or reseated the NVMe drive.
- Ensured connections were secure.

#### **Observed Results:**

- BIOS/UEFI detected the storage device again.
- Drive returned to the boot menu.
- System was able to locate the operating system.

#### **Example BIOS Indicator:**

- Drive listed again under storage information:
    - "SATA SSD: Detected"
    - "NVMe SSD: Present"
- 

### **4. Final System Verification**

**Checks Performed:**

- ☐ Confirmed the PC booted successfully.
- ☐ Verified the storage drive appeared in BIOS/UEFI.
- ☐ Checked that files and applications loaded normally.
- ☐ Confirmed no repeated boot or detection errors occurred.
