

CPU(Central Processing Unit):

The CPU act as a Brian Of Computer. In game like pubg or Free Fire CPU Handles game logic, Player action, Enemy Behavior, Physics and game event. And CPU communication between hardware Component. A faster CPU helps the game run more smoothly, especially during intense Gameplay.

RAM(Random Access Memory):

Ram temporarily stores game data that the CPU and GPU need to access quickly like map data, textures, player stats and active assets so the CPU can access it instantly without waiting. Too little Ram causes long load times and even game crash because system can't hold enough of the game world at once. More Ram helps reduce lag and improve multitasking while gaming.

GPU(Graphics Processing Unit):

The GPU is responsible for rendering images, animations, and visual effects on the screen. GPU is rendering thousands of polygons, applying textures. Lightning, Shadows and visual effects in real time frame by frame. A More powerful GPU lets you crank up graphic settings and hit higher frame rates, make game look sharper and feel much smoother.
