

Upgrade PC to play latest FIFA Smoothly

1 GPU(Graphic Card):

FIFA is a High Graphic Game with detailed player models, stadium lighting, crowd, animation etc. if you current GPU overload, face low frame rate and low graphic setting. Upgrade to a more powerful graphics card can increase the frame rates, improve graphics settings and provide smooth gameplay.

2. CPU(Processor):

FIFA game run complex simulations every second like player ai, ball physics, referee logic, crowd behavior and match event all rely on CPU power. An weaker CPU creates bottlenecks meaning even a great gpu can't perform well because low CPU. Upgrade Modern Multi core processor to improve smoothly Gameplay.

3. RAM(Random Access Memory):

The latest FIFA load large amounts of data. More ram allows the game to store and access data quickly. Upgrade to at least 16gb ram can improve game loading times, reduce lag, and support multitasking while gaming.

4. Storage(SSD):

Replace hard drives to SSD to reduce Game loading time and speed up system performance. An SSD help to FIFA load matches, Memu and update faster.

5. Power Supply (SMPS):

Upgrade to more powerful GPU or CPU, The smps also need to upgrade to provide a enough stable power for the new component.

6. Cooling System:

Better cooling system, such as a improve fans or a CPU cooler helps to reduce to overheating during long gaming.
