

Tool	What it Checks	Example Problem Detected
Multimeter	Measures electrical values such as voltage, current, resistance, and continuity in computer or smartphone components.	Detects a faulty power supply (PSU), dead battery, broken charging cable, or short circuit.
POST Card	Displays POST (Power-On Self-Test) codes generated by the motherboard during startup to identify hardware initialization errors.	Identifies hardware issues such as faulty RAM, CPU, motherboard, or BIOS when the computer fails to boot.
Software Diagnostics (e.g., HWMonitor, Speccy, CrystalDiskInfo)	Monitors system health, including CPU and GPU temperatures, RAM information, storage health, SMART status, and hardware specifications.	Detects an overheating CPU, failing hard drive/SSD, insufficient memory, or abnormal hardware performance.
