1. **On your Windows Server VM, open the DHCP Manager and create a new DHCP scope named 'CampusWiFi' with an IP address range of 192.168.50.100 to 192.168.50.200 and a subnet mask of 255.255.255.0.**
   - 

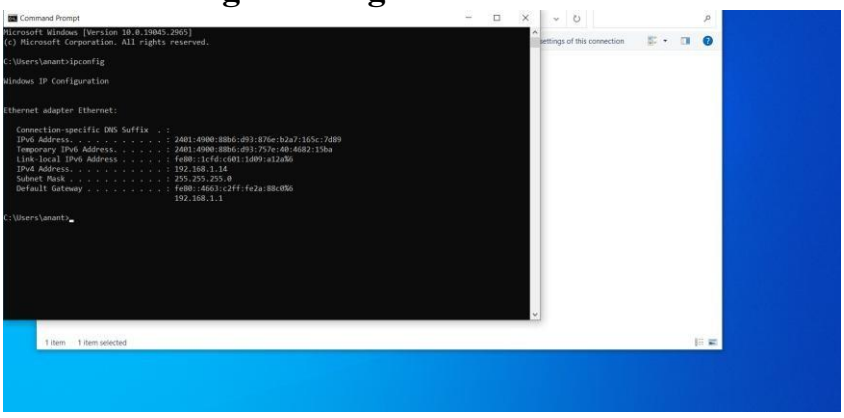

2. **Add a DHCP reservation for a device (use your own laptop's MAC address if possible) so it always receives the IP address 192.168.50.150 from the 'CampusWiFi' scope.

Hint: Right-click Reservations in your scope, choose 'New Reservation', and enter the MAC address.**
   - 

3. **Configure the DHCP lease duration for the 'CampusWiFi' scope to 2 days instead of the default setting.**

4. **Connect a client machine (or use a virtual client) to the network and verify it receives an IP address from your DHCP scope; take a screenshot showing the assigned IP in the client's network settings.**

5. **Document your entire DHCP setup process in a Word or PDF file, including screenshots of the scope creation, reservation, lease duration change, and the client receiving its IP address.**

- DHCP Scope Modification:
- Opened the DHCP Manager (dhcpmgmt.msc) on the Windows Server.
- Navigated to IPv4 -> CampusWiFi scope, right-clicked on it, and selected Properties.
- Under the General tab, changed the *Lease duration for DHCP clients* from the default setting to 2 Days.
- Clicked Apply and OK to save the changes. Client Verification:
- Connected the client machine to the network.
- Opened Command Prompt and ran ipconfig /release followed by ipconfig /renew to fetch a new IP address from the DHCP server.
- Verified via ipconfig command that the client successfully received its assigned IP address from the CampusWiFi scope under the updated lease terms
