1. **Open Hyper-V Manager on your Windows Server machine and create a new virtual machine named 'MyTestVM' with default settings.**
   ⭘

2. **Configure a virtual switch in Hyper-V Manager that allows your virtual machines to access the internet, and attach 'MyTestVM' to this switch.

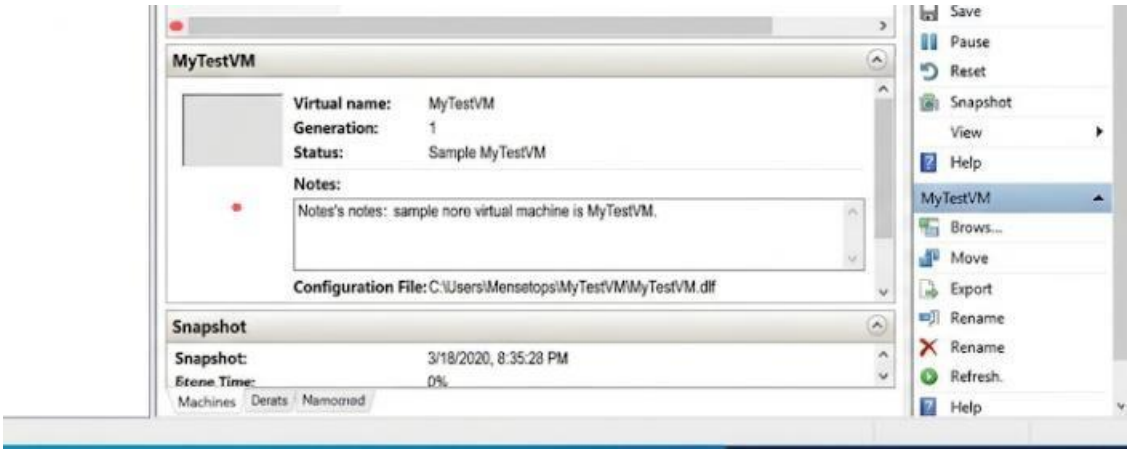

Hint: Use the Virtual Switch Manager and select 'External' for internet access.** ⭘

   Part 1: Create an External Virtual Switch

   1. Open Hyper-V Manager on your Windows Server.
   2. In the right-hand Actions pane, click on Virtual Switch Manager...
   3. In the Virtual Switch Manager window, ensure External is selected under the What type of virtual switch do you want to create? options.
   4. Click the Create Virtual Switch button.
   5. Configure the switch settings:
      - Name: Give it a recognizable name (e.g., ExternalSwitch or InternetSwitch).
      - Connection type: Select External network and choose your physical network adapter (Ethernet/Wi-Fi card) from the dropdown menu.
      - Check the box for Allow management operating system to share this network adapter (this ensures your host server retains its own internet connection).
   6. Click Apply and then OK. (Note: A brief network interruption may occur while the virtual switch binds to your physical adapter).

   Part 2: Attach 'MyTestVM' to the Virtual Switch

1. In the main Hyper-V Manager window, locate MyTestVM in the Virtual Machines list.
2. Right-click MyTestVM and select Settings...
3. In the left-hand hardware list of the Settings window, click on Network Adapter.
4. On the right side, find the Virtual switch dropdown menu and select the external switch you just created (ExternalSwitch).
5. Click Apply and then OK to save the changes.

3. **Install a Windows 10 ISO on 'MyTestVM' and ensure it boots successfully to the desktop.**

1.Mount the Windows 10 ISO:VM Settings.

Open Hyper-V Manager, right-click MyTestVM, and select Settings. In the left pane, click on DVD Drive (or IDE Controller / SCSI Controller where your media drive is located). Under Media, select Image file, browse to select your downloaded Windows 10 ISO file, click Apply, and then OK.

Verification: The path to the Windows 10 ISO is correctly displayed under the DVD Drive settings.

2.Configure the Boot Order: Firmware Check.

In the MyTestVM Settings window, click on Firmware under the left hardware menu. Ensure that DVD Drive is moved to the top of the boot order list (above the Hard Drive) so the VM boots from the installer media first. Click Apply and OK.

Verification: DVD Drive is listed **first in the VM's boot sequence.**

3.Start and Connect to the Virtual Machine: Console Access.

Right-click MyTestVM in the Hyper-V Manager list and click Start. Once the state changes to *Running*, right-click the VM again and click Connect... to open the Virtual Machine Connection window.

Verification: The VM console window opens, displaying the Windows setup loading screen.

4.Complete Windows Setup and Reach Desktop: Interactive Installation.

Follow the on-screen Windows 10 setup wizard: select your language, click Install Now, enter your product key (or click *I don't have a product key*), choose Custom: Install Windows only (advanced), select the virtual hard disk, and let the files copy. Once the installation completes, go through the initial region, keyboard, and user account configurations until the standard Windows 10 desktop appears.

Verification: The VM successfully loads and displays the Windows 10 desktop interface.

4. **Take a snapshot (checkpoint) of 'MyTestVM' after installation, then make a change inside the VM (like creating a folder on the desktop), and restore the VM to the checkpoint to verify the change is undone.** ✪

5. **Use ChatGPT or Copilot to generate PowerShell commands for creating a new Hyper-V VM with 2GB RAM and a 40GB disk, then run the commands and verify the VM appears in Hyper-V Manager.** ⭕
