

Here are two practical solutions:

Option 1: Powerline Adapter

How it works:

- A powerline adapter uses your home's electrical wiring to transmit network data.
- Plug the **first adapter** into a power outlet near the WiFi router and connect it to the router with an Ethernet cable.
- Plug the **second adapter** into a power outlet near your gaming PC and connect it to the PC using an Ethernet cable.

Why it's useful:

- No need to run a long Ethernet cable through the house.
- Provides a stable wired connection, which is often better for **online gaming**, video calls, and large game downloads than Wi-Fi.

Option 2: WiFi Extender (with Ethernet Port)

How it works:

- Place the WiFi extender halfway between the router and your gaming PC, where it still receives a strong Wi-Fi signal.
- The extender connects wirelessly to the router.
- Connect your gaming PC to the extender using an Ethernet cable.

Why it's useful:

- Extends Wi-Fi coverage to areas with weak signals.
- Lets an Ethernet-only PC access the Wi-Fi network without installing long cables.
- A good option when running cables isn't practical.
