

Temporary IPv6 Address Test

Objective

Set up or verify a temporary (privacy) IPv6 address and observe whether it changes after a reboot or network disconnect/reconnect.

Steps Performed

1. Open Command Prompt.
2. Run:
`ipconfig`
3. Note the temporary IPv6 address
4. Restart the computer or disable and re-enable the network adapter.
5. Run ipconfig again.
6. Compare the temporary IPv6 address before and after.

Observed Behavior

- Before restart/reconnect: Temporary IPv6 Address: 2409:40c1:403d:d10b:e9d5:3280:37f0:1b37
- After restart/reconnect: Temporary IPv6 Address: Changed to a different temporary IPv6 address : 2409:40c1:403d:d10b:8153:8f9d:aa33:788a
