

PC Assembly/Disassembly Safety Checklist

Before you start working on your computer make sure it is turned off and unplugged from the wall. After you unplug it press the power button for a seconds to get rid of any extra electricity. You should work in an dry room with a lot of light and a flat surface. Try not to work in a room with carpet because it can make electricity that can hurt your computer parts.

To keep your computer parts safe from electricity wear a special strap on your wrist that touches a metal thing that is connected to the ground. You can also touch a metal thing that is connected to the ground a lot. Always pick up computer parts like the motherboard and the graphics card by the edges. Do not touch the small parts. Keep food and drinks away from where you're working so you do not spill anything on your computer parts.

Tools Required and Their Importance

- * Phillips-head screwdriver – you need this to remove and put back screws on the computer case and parts.
- * -static wrist strap – this keeps static electricity from hurting your computer parts.
- * -static mat – this is a safe place to put your computer parts when you are not using them.
- * container or magnetic tray – this helps you keep track of small screws and parts.
- * Flashlight or desk lamp – this helps you see inside the computer case.
- * Cable. Velcro straps – these help keep the cables organized and make it easier for air to get inside the computer.
- * Needle-nose pliers – these are good for picking up parts or getting screws that have fallen.
- * paste – you need this when you are putting in a new CPU cooler so it can get rid of heat properly.
- * Isopropyl alcohol and lint-free cloth – these are used to clean old thermal paste from the CPU and the heatsink.
- * air – this is used to blow away dust from the fans and the inside of the computer.

Final Safety Check

Before you start make sure the power cable is not plugged in you are wearing your -static strap you have all the tools you need and you have a safe place to put your computer parts. Never force anything into place because it can hurt your computer. If something does not fit

check it again to make sure it is in the spot. If you follow these rules you can help keep your computer safe and make sure you do not get hurt when you are working on it. Always remember to check the computer parts, like the motherboard and the graphics card to make sure they are safe.
