

Setting Up a Gaming Café with 10 PCs

For a gaming café with 10 PCs, I would choose **Ethernet cables (Cat6 or Cat6a)** instead of fiber optic cables. Ethernet is the best choice because it provides high-speed, stable, and low-latency connections, which are essential for LAN gaming. Since all the computers are located in the same room or building, the maximum cable distance will be well under Ethernet's 100-meter limit. Ethernet is also much more affordable than fiber optics, making it the most practical option for a small gaming café.

The tool I would use is an **RJ45 crimper**. This tool is used to attach RJ45 connectors to the ends of Ethernet cables, allowing them to connect to computers and network switches. An RJ45 crimper is inexpensive, easy to use, and ideal for creating custom-length network cables. It also helps ensure secure and reliable cable connections.

Why Not Fiber Optics?

Although **fiber optic cables** offer extremely high speeds and can transmit data over very long distances, they are unnecessary for a gaming café with only 10 PCs in the same location. Fiber cables, fiber switches, and installation tools are much more expensive. The **fiber cleaver**, which is used to cut fiber optic cables precisely before splicing or terminating them, requires more skill and is mainly used in large networks, data centers, or connections between buildings.

Feature	Ethernet (Cat6/Cat6a)	Fiber Optics
Speed	Up to 10 Gbps	10 Gbps to 100+ Gbps
Maximum Distance	100 meters	Several kilometers
Cost	Low	High

Feature	Ethernet (Cat6/Cat6a)	Fiber Optics
Installation	Easy	Complex
Tool Required	RJ45 Crimper	Fiber Cleaver
Best For	Homes, offices, gaming cafés	Data centers, ISPs, long-distance networks

Final Decision

For a **10-PC gaming café**, I would choose **Ethernet (Cat6 or Cat6a) cables** and an **RJ45 crimper**. This combination provides fast, reliable, and low-latency network performance while keeping installation and maintenance costs low. Fiber optics would only be necessary if the network needed to cover very long distances or required extremely high bandwidth beyond what Ethernet can provide.
