

Step	Command	Purpose	What It Checks
1	ipconfig	Check the computer's network configuration.	Verifies that the laptop has a valid IPv4 address , Subnet Mask , and Default Gateway . If the IP address is incorrect (e.g., 169.254.10.1), the device is not properly connected to the network.
2	ping zomato.com	Test basic network connectivity to the website.	Checks whether the laptop can reach Zomato's server. If replies are received, the network connection is working. If the request times out, there may be a connectivity or server issue.
3	nslookup zomato.com	Verify DNS name resolution.	Checks whether the domain name zomato.com is being translated into an IP address. If DNS resolution fails, the problem is likely with the DNS server rather than the internet connection.
