

Q-Research and list 3 real-world scenarios where SNMP is used in network management for apps or services you use (such as ISPs, campus WiFi, or large websites).

Hint: Think about how network admins monitor device health, bandwidth, or uptime.

Scenario	How SNMP Is Used	Example
1. Internet Service Provider (ISP)	Network administrators use SNMP to monitor routers, switches, and customer equipment. They track bandwidth usage, interface status, CPU utilization, and detect device failures.	Jio, Airtel, BSNL monitor their network devices to ensure stable internet service and quickly identify outages.
2. Campus or Office Wi-Fi	SNMP monitors wireless access points and switches. Administrators can check the number of connected users, signal quality, bandwidth usage, and whether an access point has gone offline.	A college campus Wi-Fi network uses SNMP to monitor all access points and resolve connectivity issues quickly.
3. Large Websites and Cloud Services	Data centers use SNMP to monitor servers, switches, firewalls, and load balancers. It helps track uptime, network traffic, hardware health, and generates alerts when a device or link fails.	Companies such as Google, Amazon, and Microsoft use SNMP-based monitoring tools within their data centers to maintain reliable online services.

Why SNMP is Important

- Monitors network device health (CPU, memory, temperature)
- Tracks bandwidth and network traffic
- Sends alerts when devices fail or links go down
- Helps maintain high network uptime and troubleshoot problems quickly
