

SMPS (Switched Mode Power Supply) devices

1. Laptop charger – efficiently converts AC mains to the low-voltage DC needed to charge the battery and run the laptop while minimizing heat and size.
2. Smartphone wall adapter – provides a stable 5 V DC output for charging phones using a compact, high-efficiency switching circuit.
3. LED television – powers the display's backlight and internal circuitry with a reliable, efficient conversion from AC to the various DC voltages required.

UPS (Uninterruptible Power Supply) devices

1. Desktop computer – keeps the system running during power drops or outages, preventing data loss, file corruption, and abrupt hardware shutdowns.
2. Network router/modem – sustains internet connectivity for a short period when the mains fail, allowing continued Wi-Fi/Ethernet access for devices and VoIP calls.
