

1 ATX 24-pin motherboard connector

What it powers:

- The motherboard itself. Indirectly supplies power to the CPU, RAM, PCIe slots, and onboard components through the motherboard.

Safety tip:

- Turn off the PSU and unplug the power cord before connecting or disconnecting. Press the connector's latch before removing it—never pull on the wires.

2 SATA Power Connector

What it powers:

- SATA SSDs. SATA hard drives (HDDs)
- Optical drives (DVD/Blu-ray drives)

Safety tip:

- Align the L-shaped key correctly. If it does not slide in easily, do not force it; forcing it can damage the connector.

3 Molex (4-Pin Peripheral) Connector

What it powers:

- Older IDE/PATA hard drives. Older optical drives. Some case fans, fan controllers, and accessories.

Safety tip:

- Pull the plastic housing—not the wires—when disconnecting. Molex connectors can be tight and pulling on the wires may damage the cable or loosen pins.

4. PCIe 6-Pin / 8-Pin Connector

What it powers:

- Dedicated graphics cards (GPUs). Other high-power PCIe expansion cards.

Safety tip:

- Use only PCIe power cables for GPU connectors. Do not force an EPS/CPU 8-pin cable into a PCIe socket; although they may look similar, the wiring is different and can damage hardware.
