

If a friend is experiencing slow internet while gaming online, I would recommend the following troubleshooting steps:

I would first restart the router and modem, as this is a quick and simple step that often resolves temporary network issues and improves internet performance.

1. Use a Wired Ethernet Connection

- Connect the gaming device directly to the router using an Ethernet cable for a more stable and faster connection.

2. Restart the Router and Modem

- Power off the router and modem for about 30 seconds, then turn them back on to refresh the network.

3. Reduce Network Congestion

- Disconnect unused devices or pause large downloads and video streaming while gaming.

4. Place the Router in a Better Location

- Keep the router in a central, open area away from walls, metal objects, and electronic devices that may cause interference.

5. Update Router Firmware

- Check for firmware updates to improve router performance, security, and stability.

6. Use the 5 GHz Wi-Fi Band

- If using Wi-Fi, connect to the 5 GHz network for higher speeds and lower interference (when within range).

7. Check Internet Speed

- Run an internet speed test to verify that the connection meets the game's recommended requirements.
