

List 5 common issues users face with USB keyboards or mice on laptops, and write one possible solution for each.

1. Device Not Recognized

The pc fails to detect the keyboard or Mouse when Plugged in.

Solution : Try different USB port. If doesn't work, open Device Manager then uninstall the unknown device then replug it to force a fresh driver installation.

2. Cursor/Keys Lagging or Freezing

Input is delayed or occasionally stops responding.

Solution : Disable USB selective Suspend- got to Power Options- Change plan settings-Advanced Power setting- USB settings and set it to Disable. This prevents the system from powering down USB ports to save energy.

3. Driver Conflicts or Outdated Drivers

The device works intermittently or not at all due to driver issues.

Solution : Visit the manufacturer web site and download the latest drivers. Alternatively, in device manager, right click the device and select Update driver – Search automatically. A clean reinstall often resolves configuration.

4. Device works on One USB Port but Not Another

The peripheral functions on some ports but is dead on others.

Solution : This usually points to a faulty or underpowered USB port. Check if the non working port is USB 2.0 vs 3.0. we can also use a powered USB hub to ensure stable power delivery to all connected devices.

5. Scroll Wheel or Extra Buttons Not Working

Basic clicks work but special keys or scroll functions are unresponsive

Solution : Install the manufacturer companion software. Generic OS drivers often support only basic functions brand software unlocks full device Functionality
