

No.	Action	How it Helps in a College Computer Lab
1	Use strong passwords and Multi-Factor Authentication (MFA)	Protects admin accounts and prevents unauthorized access to lab systems.
2	Keep operating systems and software updated	Regularly install security patches on all lab computers to reduce vulnerabilities.
3	Install and update antivirus and firewall software	Detects malware and blocks unauthorized network traffic on all lab PCs.
4	Restrict physical access to the server room	Use biometric access or smart ID cards so only authorized staff can enter.
5	Secure network equipment with locks and CCTV	Lock switches, routers, and servers in network racks and monitor them with CCTV cameras to prevent theft or tampering.
6	Perform regular data backups	Back up student records, lab configurations, and important files to protect against ransomware or hardware failure.
7	Educate students and staff on cybersecurity	Train users to recognize phishing emails, avoid unsafe USB devices, and follow acceptable computer lab usage policies.

This checklist is specifically designed for a **college computer lab** where many students use shared computers. It focuses on:

- Protecting shared PCs from malware and unauthorized changes.
- Securing the server room and networking devices.
- Preventing misuse of student accounts.
- Ensuring important academic data is backed up.
- Increasing cybersecurity awareness among students and staff.
