

Your IP address **192.168.1.300** is invalid because each number (called an octet) in an IPv4 address must be between **0 and 255**. Since **300** is greater than **255**, the device cannot use that address to communicate on the network.

If you're using the **192.168.1.0/24** subnet, a valid IP address would look like **192.168.1.x**, where **x** is a number from **1 to 254** (avoiding **0**, which is the network address, and **255**, which is the broadcast address). For example, **192.168.1.100** is a valid IP address in that subnet.
