

Given a sample packet filtering rule set (provided by your trainer), identify which of these three sample packets would be allowed or blocked: 1) HTTP request from 192.168.1.5 to 172.217.166.78:80, 2) SSH request from 10.0.0.10 to 34.201.23.1:22, 3) DNS query from 192.168.1.7 to 8.8.8.8:53.

Hint: Focus on source/destination IPs and ports in the rule set.

Note : We can't determine which packets are **allowed** or **blocked** without the **packet filtering rule set**. The decision depends entirely on the firewall rules (source IP, destination IP, protocol, ports, and action).

for example:

Rule	Source IP	Destination IP	Protocol	Port	Action
1	Any	Any	TCP	80	Allow
2	Any	Any	TCP	22	Block
3	Any	Any	UDP	53	Allow

These three packets:

1. **HTTP request** from **192.168.1.5** → **172.217.166.78:80**
2. **SSH request** from **10.0.0.10** → **34.201.23.1:22**
3. **DNS query** from **192.168.1.7** → **8.8.8.8:53**
