

No.	Device	Network Type	Detailed Information
1	Smartphone	PAN, WLAN, WAN	A smartphone connects to different types of networks. It uses PAN when connected to Bluetooth devices such as earbuds or a smartwatch. It uses WLAN when connected to a Wi-Fi router at home, college, or office. It also uses WAN through 4G or 5G mobile networks to access the internet over large distances.
2	Laptop	LAN, WLAN, WAN	A laptop connects to a LAN using an Ethernet cable in an office, lab, or home. It connects to a WLAN when using Wi-Fi. Through the router and Internet Service Provider (ISP), the laptop can access the wider internet, which is part of a WAN .
3	Wi-Fi Router	LAN, WLAN, WAN	A Wi-Fi router is an important networking device. It creates a local network for devices such as phones, laptops, printers, and smart TVs. Wired devices connect through LAN , wireless devices connect through WLAN , and the router connects the local network to the internet through a WAN connection provided by the ISP.
4	Smart TV	LAN, WLAN, WAN	A smart TV connects to a home network using Wi-Fi (WLAN) or an Ethernet cable (LAN). It then accesses online services over the internet (WAN) to stream videos, download apps, receive updates, and use online platforms such as YouTube or Netflix.
5	Smartwatch	PAN, WLAN, WAN	A smartwatch usually connects to a smartphone using Bluetooth, which creates a short-range PAN . Some smartwatches can also connect directly to WiFi (WLAN). Cellular models can use 4G or LTE networks to access the internet over a WAN , even when the phone is not nearby.

- **PAN – Personal Area Network:** A small network around one person, usually within a few meters. Example: smartphone connected to a smartwatch using Bluetooth.
- **LAN – Local Area Network:** A network covering a small area such as a home, computer lab, school, or office. Example: computers connected by Ethernet cables.
- **WLAN – Wireless Local Area Network:** A LAN that uses wireless communication, usually WiFi. Example: a laptop connected to a home WiFi router.
- **WAN – Wide Area Network:** A network covering a very large geographical area. The internet is the best-known example of a WAN.
