

Q-Create a table comparing at least two different AAA deployment models (such as centralized vs distributed), listing three advantages and three disadvantages of each for a company like Zomato that handles sensitive user data.

Feature	Centralized AAA	Distributed AAA
How it works	A central AAA server manages authentication, authorization, and accounting for multiple systems.	Each location, department, or network manages its own AAA services.
Advantage 1	Easy management: Policies and user accounts can be managed from one place.	Better local control: Each department/location can customize access according to its needs.
Advantage 2	Consistent security: The same access policies can be applied across the company.	Less dependency: One AAA system failing does not necessarily affect every location.
Advantage 3	Centralized logging: Security and access logs are easier to collect and monitor.	Better performance locally: Authentication requests can be handled closer to users.
Disadvantage 1	Single point of failure: If the central AAA service goes down and redundancy is inadequate, many systems may be affected.	Harder management: Many AAA systems must be configured and maintained separately.
Disadvantage 2	High-value target: An attacker compromising the central AAA infrastructure could potentially affect many systems.	Inconsistent policies: Different locations may accidentally use different security rules.
Disadvantage 3	Network dependency: Systems may need connectivity to the central AAA service for authentication.	More expensive: Maintaining multiple AAA servers and administrators can increase costs.
