

**Q-Pick any app you use daily (Instagram, Paytm, or Flipkart) and write a paragraph explaining how AAA concepts could be applied to secure user logins and actions within that app.

Hint: Think about what happens when you log in, what features you are allowed to use, and how your actions might be tracked for security or billing.**

Example: Paytm

Paytm can use **AAA (Authentication, Authorization, and Accounting)** to secure user accounts and transactions. **Authentication** happens when a user logs in using their mobile number, password, OTP, or biometric verification to prove their identity. **Authorization** then determines what the user is allowed to do, such as sending money, paying bills, or viewing transaction history. For example, a user cannot access another person's account or perform actions without the required permission. **Accounting** records activities such as login time, transactions, payment amounts, and device information. These records can help detect suspicious activity, investigate security incidents, and maintain transaction records.
