

College Wi-Fi AAA Policy

Purpose: The college Wi-Fi network will use AAA (Authentication, Authorization, and Accounting) to ensure that only authorized students can access the network and that network activity is properly controlled and recorded.

1. Authentication – Verify the User

- Only currently enrolled students are allowed to connect to the college Wi-Fi.
- Students must log in using their college-provided username and password.
- An authentication server such as RADIUS will verify the student's credentials.
- Invalid login attempts will be rejected.

2. Authorization – Control Access

- After successful authentication, the system will check the student's access permissions.
- Students will be allowed to access approved educational websites, college portals, and other permitted internet services.
- Restricted or unauthorized websites and services will be blocked according to college network rules.
- Administrative systems and other restricted resources will not be accessible to regular students.

3. Accounting – Record Activity

- The network will record successful and unsuccessful login attempts.
- Logs may include username, date and time, IP address, device information, and network usage.
- Network administrators will use these logs for security monitoring, troubleshooting, and investigating suspected misuse.
- Access logs will be protected and retained according to the college's applicable policies.

Policy Flow

Student → Wi-Fi Access Point → Authentication → Authorization → Internet Access → Accounting/Logging

How the Three AAA Functions Are Addressed

AAA Function	How it is used
Authentication	Checks whether the person is a valid college student.
Authorization	Determines which websites and network resources the student can access.
Accounting	Records login attempts and network activity for monitoring and security.
