

Q- Explain in 3-4 sentences how dynamic routing in apps like Uber or Zomato delivery tracking is similar to RIP dynamic routing in networks. Focus on how routes or paths are updated automatically in both cases.

Dynamic routing in networks like **RIP** is similar to Uber or Zomato because routes are updated automatically when conditions change. In RIP, routers share information with each other and choose a new path if the current path becomes unavailable or less suitable. Similarly, Uber or Zomato can update a driver's delivery route based on traffic, road closures, or other changes. In both cases, the main goal is to **automatically find an efficient and available path without manually changing the route.**
