

When we Open a Music app like Spotify both the CPU and chipset help your computer

CPU :

When we Click on Spotify then CPU Executes the Spotify Program code. Load the user Interface then decodes audio data so it can be played through your speakers.

Chipset:

The chipset is group of controllers on the motherboard that manages communication between the CPU and hardware components. Chipset Connect the CPU to storage devices like SSD/HDD. Manages USB ports, network devices and also audio hardware.

When we open Spotify that chipset help the CPU access Spotify file stored on the SSD. Manages network communication so Spotify can download music from the internet. Connects the audio hardware that outputs sound to your speakers or headphones.

When work Together

When click Spotify icon that time CPU receives the command to open Spotify. Chipset helps retrieve Spotify file from the SSD Then CPU load and run the application. Chipset help to manage the network connection so Spotify can stream Music. CPU process and decodes the audio stream. Chipset send the audio data to the sound hardware.
